

Windows Server Virtualization

Within VMware, create a new machine and name it appropriately.

Before you continue, you will need to select the correct ISO so that VMware will actually create Windows Server.

Open file explorer and in your downloads, find the circled file. The file should be named something along the lines of "windows_server_2025". Once you select the file, you will be brought back to VMware installation

Windows Server Virtualization

where you can continue.

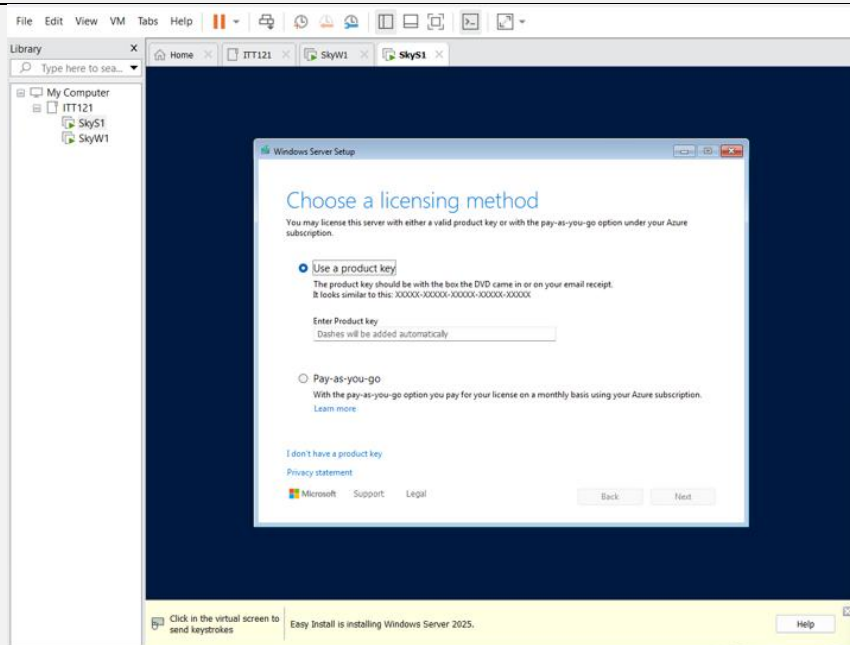

For the server installation, you will have the option to set a password during the VMware setup. Set the password as “Red.vine1” for both input boxes. Continue through the rest of the installation.

Before you select finish, make sure that you have the correct amount of hard disk space allocated (64GB), correct amount of memory (4096MB), and the correct amount of cores (2 CPU cores).

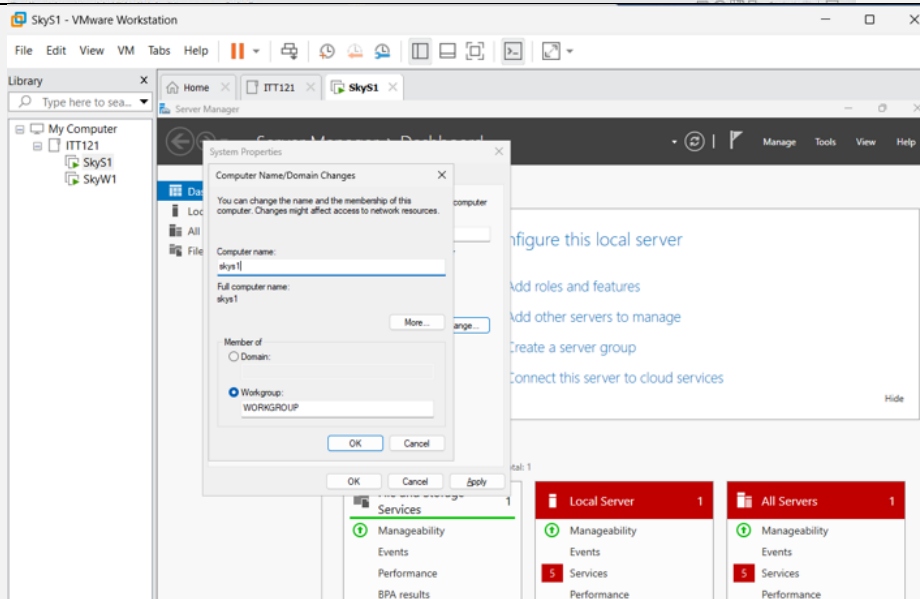

Windows Server Virtualization

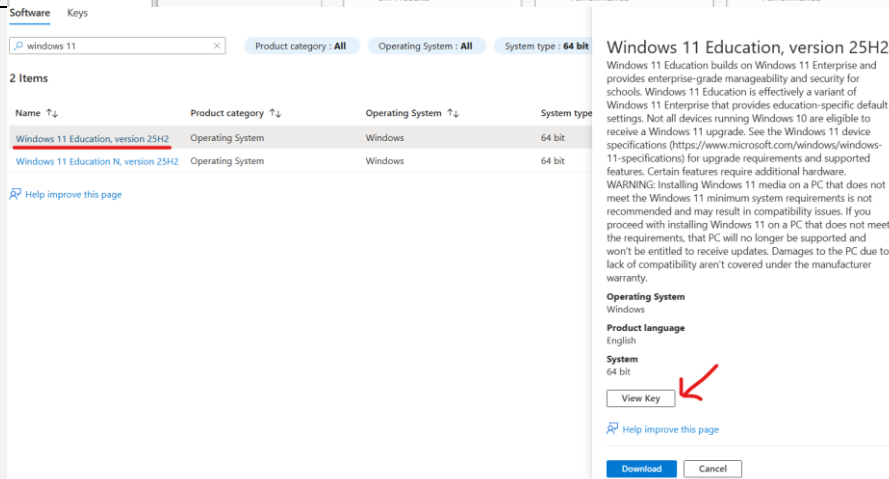

The machine will now launch and you can work your way through the installation, the most demanding step in this process is entering the license key when prompted. This is the key we saved from Azure. Enter the key and continue through the installation.

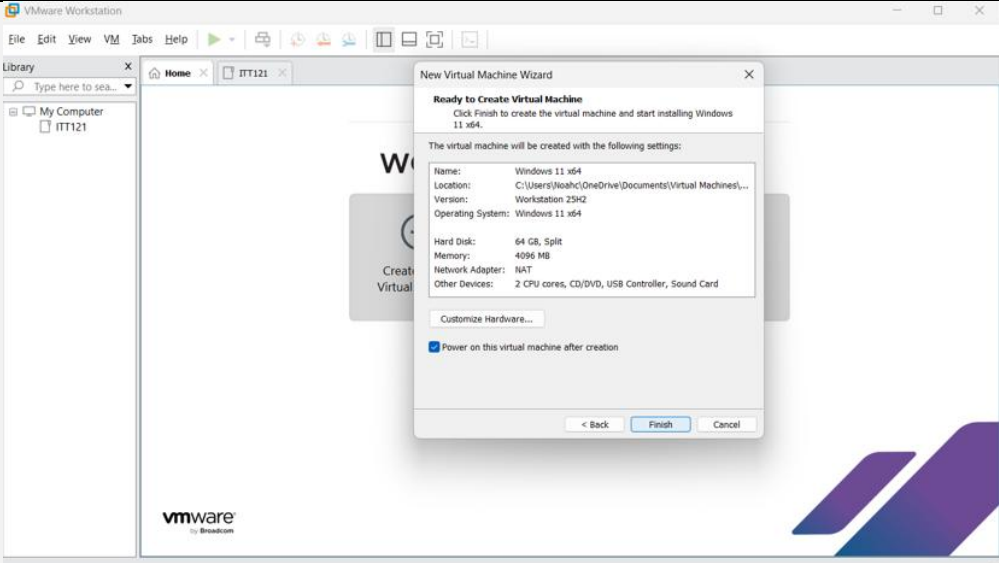

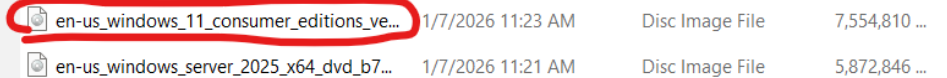

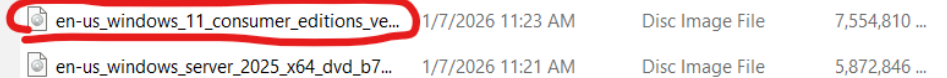

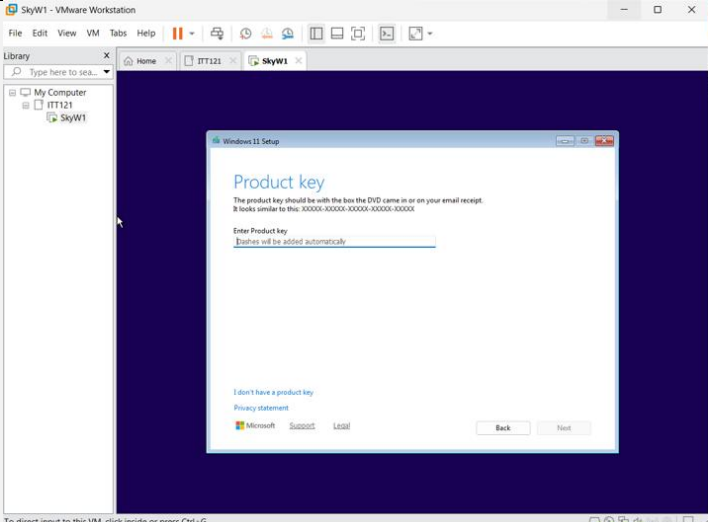

Once the VM finishes and you are logged into the server, press the windows icon key on your keyboard and type in “sysdm.cpl” and press enter. This will pull up the system properties screen. Choose the “change” button and rename the server appropriately. After this the machine will need to restart.

No we will repeat this process for Windows 11 with very few differences. Start by finding the ISO on Azure. In the free software, search for “windows 11” and choose **windows 11 education**. Do not choose the N version. Make sure to view and save the key before

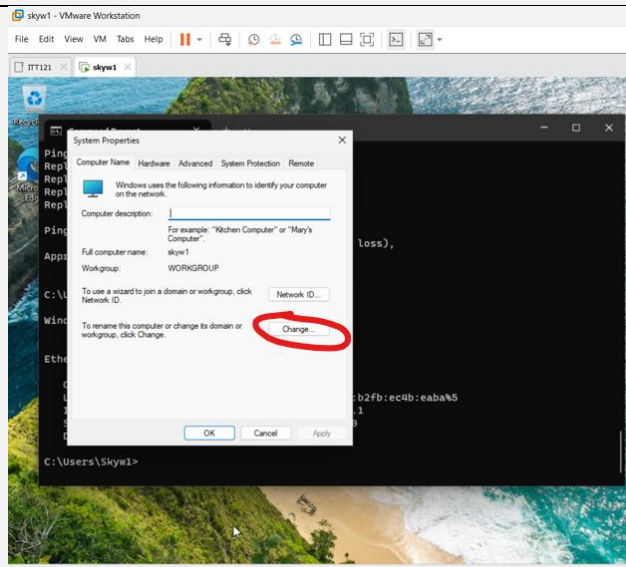

Windows Server Virtualization

downloading the image.				
Once the image has finished downloading, create a new VM in VMware and move through the setup, before you finish the setup make sure your disk, memory, and CPU core match what is on screen. (64GB, 4096MB, 2 CPU cores).				
Make sure to choose the correct image				
Once the machine starts up it will once again ask you for the product key, enter this key here before moving on with the installation process.				

Windows Server Virtualization

Once the machine finishes downloading and you are inside the Windows 11 desktop, use “sysdm.cpl” in the search bar to find system properties. Choose the “change” option and give the workstation an appropriate name.

After renaming the machine it will need to restart. After this process you will have both the server and windows 11 installed.
